Pakistan Demographic Survey-2020

Government of Pakistan
Ministry of Planning, Development and Special Initiatives
Pakistan Bureau of Statistics

November – 2022

Pakistan Demographic Survey (PDS) is a regular activity of PBS, conducted during inter-censal period to provide reliable data on Demographic Indicators. These Demographic statistics are inevitable for policymakers, planners and administrators for planning of development programmes for the National & Provincial Governments.

Pakistan Demographic Survey (PDS), 2020 is the twentieth round of a series of surveys, initiated in 1984. After 1984 nineteen rounds of PDS were completed till 2007. Current round of PDS was started after a gap of 13 years, which provides the detailed information on various demographic indicators for the year 2018-2020 at National level with Urban-Rural breakdown. These indicators are Life Expectancy, Crude Birth Rate, Crude Death Rate, General Fertility Rate, Age Specific Fertility Rates, Age Specific Death Rates, Infant Mortality Rate and Rate of Natural Increase etc. Results of the survey are compiled at National level with Urban Rural Segregation.

The field activities of the twentieth round were carried out from 28th April 2021 to 15th October 2021. For the first time data collection was Tablet based i.e., data was collected through Electronic Devices. For this purpose, software for data collection, real time monitoring and online editing was developed by Data Processing Centre, of PBS. Wherein available results for PDS 2020 were compared with relevant indicators of PDHS 2017-18 and PSLM 2018-19. Majority of the indicators from two surveys show close proximity thus increasing credibility of PDS.

I would like to congratulate Mr. Ayazuddin, Member (C & S), PBS and the whole PDS team for the successful completion of the task.

Dr. Naeem uz Zafar

Chief Statistician
Government of Pakistan,
Ministry of Planning Development & Special Initiatives,
Pakistan Bureau of Statistics.

I would like to thank Mr. Muhammad Sarwar Gondal and his team for the Digitization of PDS Survey. I am grateful to Ms. Rabia Awan, DDG for her valuable input in planning and designing the Methodology and for provision of Sample Design for PDS-2020 as Ex Director, Sample Design Section.

I would also like to thank Mr. Munwar Ali Ghanghro, Director PDS for his leadership in Execution of Survey, Data collection and compilation of report. The completion of the report would have not been possible without enormous hard work and devotion of PDS Technical Team lead by Ms. Ayesha Sajid, Instructor /In charge PDS. She has worked meticulously for the timely completion of the report.

The efforts of Ms. Sobia Munawwar, Director (DP) and her team for software development of questionnaire and monitoring app are really appreciable. I would also like to thank Mr. Rizwan Bashir, Director (Sample Design) for his participation in sample design of PDS-2020 and Ms. Hina Kanwal, SO (PSLM), Ms. Sana Habib, SO (PSLM) and Ms. Kaneez Amna, SO (DD & SS) for their contribution in training of field staff. Special thanks to Mr. Saqib Sultan Khawar, SO (PSLM), for his contribution towards the finalization and compilation of results. I am indebted to the field force of PBS who accepted the challenge of collecting data by visiting hard to reach areas, areas with High Security Risks in severe weather conditions.

I am also thankful to Technical Experts and Renowned Demographers, Dr. G. M Arif, Dr. Tauseef Ahmed, Dr. Naushin Mahmood, Dr. Durr-e-Nayab and Dr. Aysha Shiraz, who provided their guidance and support from time to time. Their input is always valuable and respected.

Ayazuddin

Member Census & Surveys
Government of Pakistan
Pakistan Bureau of Statistics
Ministry of Planning Development & Special Initiatives

CORE TEAM FOR EXECUTION AND FINALIZATION OF PDS-2020		
▪	Mr. Ayazuddin	Member C & S
▪	Ms. Rabia Awan	Deputy Director General
▪	Mr. Munwar Ali Ghanghro	Director
▪	Ms. Ayesha Sajid	Instructor/ In charge PDS
SOFTWARE DEVELOPMENT & DATA PROCESSING		
▪	Mr. Muhammad Sarwar Gondal	Member RM/SS
▪	Ms. Sobia Munawar	Director DP
▪	Mr. Arslan Bashir	Data Processing Officer
▪	Mr. Irfan Haider	Data Processing Officer
▪	Mr. Ghulam Kibriya	Data Processing Officer
▪	Mr. Irfan Bajwa	Data Processing Assistant
▪	Ms. Mehreen Syed	Data Processing Assistant
▪	Ms. Alina Qadeer	Data Processing Assistant
FIELD SERVICES		
▪	Mr. Muhammad Sarwar Gondal	Member RM/SS
▪	Mr. Munwar Ali Ghanghro	Director
▪	Ms. Kanwal Murtaza	Chief Statistical Officer
SAMPLE DESIGN		
▪	Ms. Rabia Awan	Deputy Director General
▪	Mr. Rizwan Bashir	Director
▪	Ms. Rumana Sadaf	Chief Statistical Officer
TECHNICAL TEAM		
▪	Mr. Saqib Sultan Khawar	Statistical Officer
▪	Ms. Hina Javed	Statistical Assistant
▪	Ms. Hafsa Batool	Statistical Assistant
▪	Ms. Tasmia Mohsin	Statistical Assistant
▪	Ms. Farah Naz	Statistical Assistant
▪	Ms. Noor-ul-Ain	Statistical Assistant
▪	Ms. Saba Bashir	Statistical Assistant
▪	Mr. Muhammad Nazir Afzal	Statistical Assistant
▪	Mr. Nasir Riaz	Statistical Assistant
▪	Mr. Adil Mahmood	Statistical Assistant

SUMMARY OF MAIN FINDINGS	1
SUSTAINABLE DEVELOPMENT GOALS (SDGs)	2
CHAPTER 1: INTRODUCTION	3
1.1 Major Indicators of PDS-2020	4
1.2 Objectives	4
1.3 Main Features of PDS-2020	5
1.4 Sample Design and Methodology	5
1.5 Methodology of PDS-2020	7
CHAPTER 2: POPULATION AND HOUSEHOLD CHARACTERISTICS	8
2.1 Percentage Distribution of Population by Broad Age Group and Sex	8
2.2 Sex Ratio	9
2.3 Population Pyramid	9
2.4 Household Size	10
2.5 Percentage distribution of households by number of persons	10
CHAPTER 3: FERTILITY	12
3.1 Crude Birth Rate	12
3.2 General Fertility Rate	12
3.3 Age Specific Fertility Rate	13
3.4 Total Fertility Rate	14
CHAPTER 4: MORTALITY	15
4.1 Crude Death Rate	15
4.2 Sex and Age Specific Mortality Rates	15
4.3 Infant Mortality Rate (IMR)	16
4.4 Neo- Natal and Post-Neo-Natal Mortality Rates	17
4.5 Causes of Death	17
CHAPTER 5: RATE OF NATURAL INCREASE AND LIFE EXPECTANCY	19
5.1 Rate of Natural Increase	19
5.2 Life Expectancy	19
5.3 Life Table	19

- **Rate of Natural Increase (2.0)**

Difference between the Crude Birth Rate and Crude Death Rate.

- **Crude Death Rate (6.7)**

Number of deaths during a year per 1000 persons.

- **Infant Mortality Rate (56)**

Number of deaths of infants under age 1 per 1000 live births in a given year.

- **Life Expectancy (65)**

Average number of years that a person is expected to live.

- **Total Fertility Rate (3.7)**

Mean number of children a women have by age 50

- **General Fertility Rate (124)**

Average number of children currently being born to women of reproductive age (15-49) in a given period.

- **Crude Birth Rate (27)**

Annual number of live births per 1,000 population.

UN has adopted new development plan for post 2015 monitoring called **Sustainable Development Goals (SDGs)** that lead us toward better future by tracking the progress in different areas at regional and global level. For effective SDG's monitoring real data and estimates are collected for:

The agenda of SDG's is very comprehensive with the aim of "leaving no one behind". 5 SDG indicators under Goal 3 are covered through PDS.

SDG Goal and Indicators covered through PDS-2020

SDG	Indicators	PDS-2020
3.1.2	Births attended by skilled health personnel (Doctors, Nurses & Midwives)%	74
3.2.2	Neonatal mortality rate (per 1000)	42
3.4.1	Mortality rate (per 1000) attributed to <ol style="list-style-type: none"> 1. Cardiovascular disease 2. Cancer 3. Diabetes 4. Chronic respiratory disease 	150 66 50 34
3.4.2	Suicide mortality rate (per 1000)	2
3.6.1	Death rate due to road traffic injuries (per 1000)	12

The Demographic Data in the developing countries is usually obtained by three sources namely Registration System, Census and Surveys. In the absence of very effective registration system, two options are left for collection and dissemination of demographic data i.e. census and surveys. Both have the advantages and disadvantages.

In Pakistan, both these methods (i.e. census and surveys) are used for collecting and disseminating the population data. The last Population and Housing Census was launched in 2017 and various demographic indicators such as population by sex & age, religion, marital status, nationality and other various housing characteristics were computed.

During the inter-censal period, the Demographic surveys are conducted to measure various Demographic indicators of the country in detail. Conventionally, Demographic surveys are not launched during the census year to avoid duplication of efforts and resources. The last demographic survey of Pakistan was conducted in 2007 (which was nineteenth in the series since it started in 1984). After 2007, PDS was not conducted due to postponements in launching of Population and Housing Census. Resultantly, huge deficiency/gap was witnessed in demographic data. In Population Census 2017, some important Demographic indicators on fertility/mortality were not covered which stressed the need for launching Pakistan Demographic Survey, at the earliest.

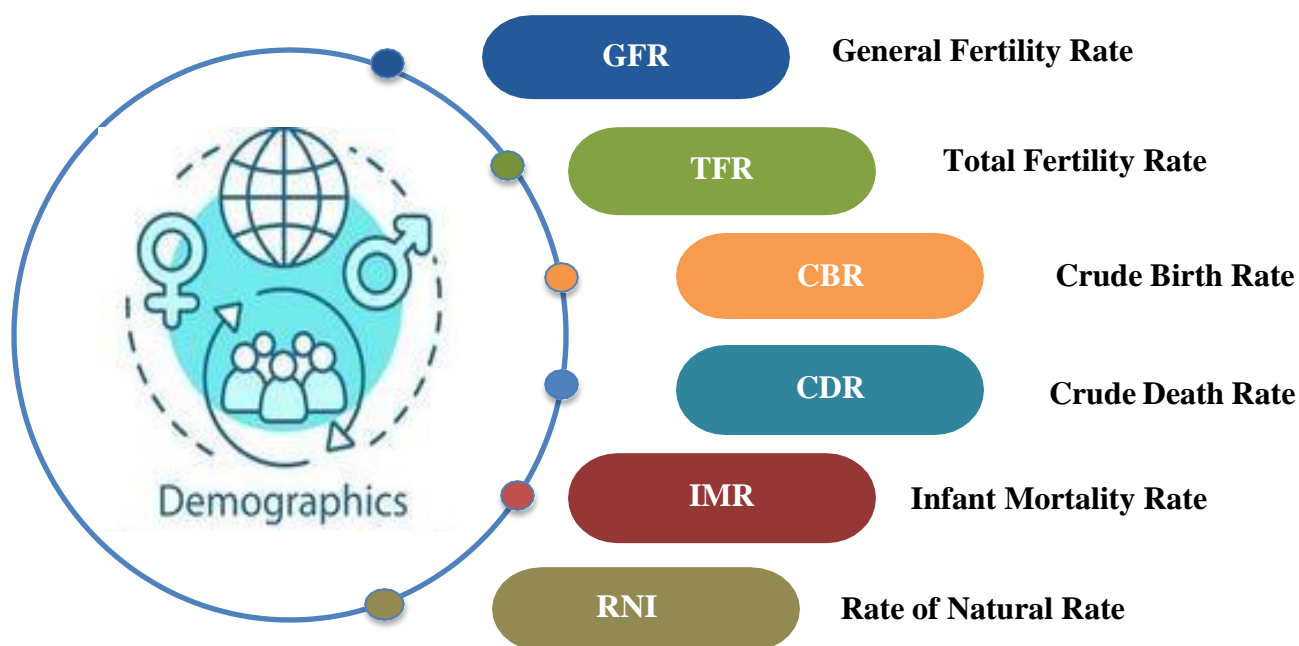

Accordingly, proposal for launching of Pakistan Demographic Survey, 2020 was placed on the agenda of 16th meeting of Governing Council of PBS, held on 15th January, 2019. In compliance with the recommendations of Governing Council, a Sub Committee, on Demographic and Vital statistics under the Chairmanship of Dr. G. M. Arif, Member of PBS, Governing Council, was formulated, comprising members from Pakistan Bureau of Statistics and other stakeholders to develop guidelines for the planned Pakistan Demographic Survey.

The first consultative meeting of the Sub Committee was held on 25th January 2019. In this meeting, need assessment of Demographic data and requirement of regular estimates of Population Growth Rate during the inter-censal period, as per objective of proposed Pakistan Demographic Survey (PDS), 2020 was discussed in detail. This proposal was also endorsed by NADRA. All participants of the Sub Committee unanimously agreed that PDS needs to be launched on regular basis at the earliest possible, as per demand of the planners and policy makers.

In view of the recommendation of the Sub-Committee, a meeting of Technical Committee on PDS-2020 was held on 20th February, 2019. In this meeting, Questionnaire, Methodology, Reference period and Scope of the proposed Pakistan Demographic Survey (PDS), 2020 was discussed in detail. It was also recommended that efforts should be made to ensure, end to end, digital conduct of PDS. It was

decided that Random Sampling method may be used and reference period will be calendar year. The reference period was 1st Jan, 2020 to 31st Dec 2020. For Data collection first time female enumerators were involved and the data was collected through team approach. The main indicators of PDS survey are given bellow.

1.1 : Major Indicators of PDS-2020

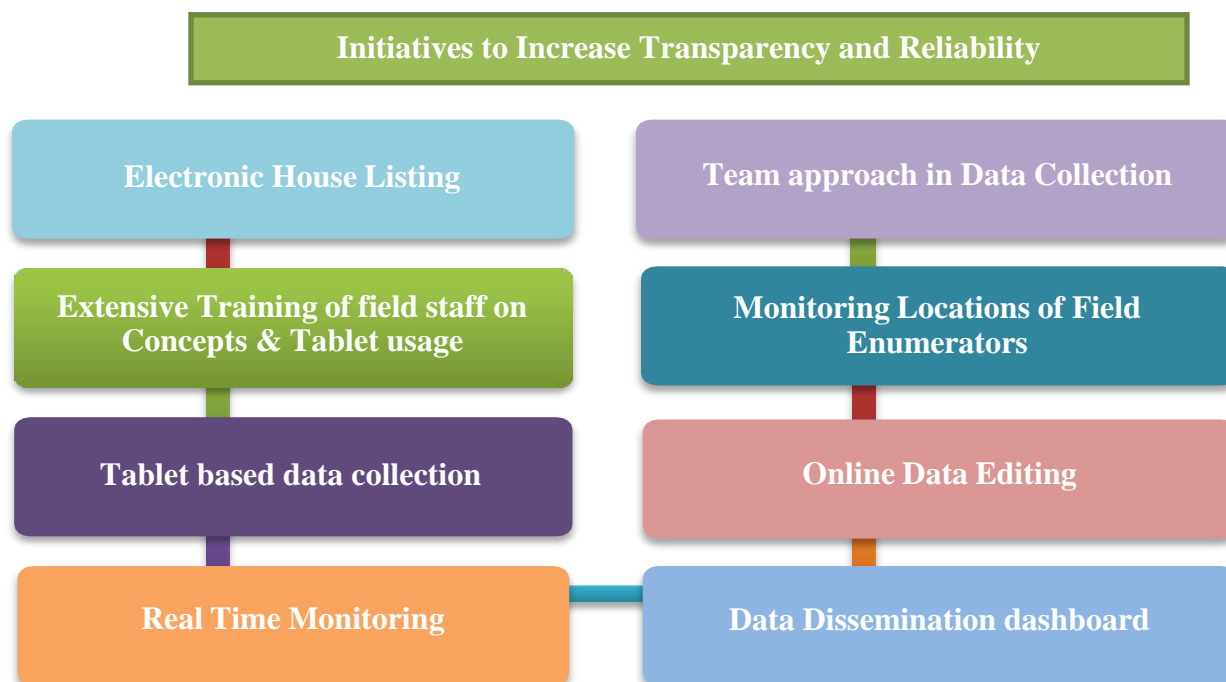

1.2: Objectives

Brief overview of objectives of PDS-2020 is given below:

- To measures the Fertility and Mortality rates in Pakistan with urban and rural breakdown.
- To estimate Current Rate of Natural Increase of population at National level.
- To collect information on other selected indicators of population e.g. (GFR, TFR, CBR, CDR, IMR, Life expectancy at birth) for planning and development programs.

1.3 : Main Features of PDS-2020

1.4 : Sample Design and Methodology

Universe: The population for survey consists of all urban and rural areas of the four provinces of Pakistan, excluded military restricted areas. The population of excluded areas constitutes about 2% of the total population.

Sample Design: A stratified two-stage sample design was adopted for the survey.

Sampling Frame: Pakistan Bureau of Statistics (PBS) has developed its own sampling frame for both urban and rural domains. Each city/town is divided into enumeration blocks. Each enumeration block comprises of 200-250 houses on the average with well-defined maps and boundaries. The updated Population and Housing Census 2017 frame was used in this survey. Details are given below:

Table 1.1: Province wise distribution of Blocks in Sampling Frame			
Province	Rural	Urban	Total
KP	22,538	3,267	25,805
Punjab	60,630	27,888	88,518
Sindh	17,239	21,892	39,131
Balochistan	8,383	1,839	10,222
Total	108,790	54,886	163,676

Sample size Estimation: Sample size is representative at National level with urban and rural breakup. Sample size has been estimated at 6% relative margin of error (RMOE) and 95% confidence coefficient.

Stratification Plan

Details of Stratification Plan are given below:

Domains of Estimation: In rural domain, each administrative district in three provinces i.e., Punjab, Sindh and Khyber Pakhtunkhwa and administrative division in Balochistan, have been considered as an independent stratum. While in urban domain, each administrative division of four provinces has been considered as separate stratum

Sample Size and its Allocation:

The distribution of sample PSUs and SSUs in the urban and rural domains of the four provinces is given in Table 1.2.

Table 1.2: Distribution of sampled PSUs and SSUs in the Urban and Rural Domain.						
Provinces	No of Sample Blocks (PSUs)			No of Sample Households (SSUs)		
	Urban	Rural	Total	Urban	Rural	Total
KP	50	108	158	2250	4860	7110
Punjab	136	295	431	6120	13275	19395
Sindh	110	90	200	4950	4050	9000
Balochistan	30	65	95	1350	2925	4275
Total	326	558	884	14670	25110	39780

Note: 45 Households per Block

Selection of Primary sampling units (PSUs): Enumeration block in both urban and rural domains are taken as Primary Sampling Units. Sample PSUs from each ultimate stratum/sub-stratum are selected with probability proportional to size (PPS) method of sampling scheme. In both urban and rural domains, the number of households in an enumeration block has been considered as measure of size (MOS).

Selection of Secondary Sampling Units (SSUs): The listed households of sample PSUs are taken as Secondary Sampling Units (SSUs). 45 households from each sample PSU are selected with equal probability using systematic sampling technique with a random start.

Dropped Areas: Seven blocks were dropped due to security and hard weather reasons, detail is given below:

Table 1.3: Dropped Areas			
Province	Balochistan	Sindh	Total
No. of Blocks	5	2	7

1.5: Methodology of PDS-2020

A snapshot of Methodology used for Pakistan Demographic Survey is as follows:

Table 1.4: Finalized Methodology of PDS-2020

Survey Name	Pakistan Demographic Survey
Frequency	Alternate years during inter-censal period
Representation	National level with Urban / Rural breakdown
Sample Size	39408 Households were covered.
Reference Period	1st Jan, 2020 to 31st Dec, 2020 (For some indicators three years preceding data was collected).
Geographical Coverage	All Urban/Rural Areas of four provinces of Pakistan. Military restricted areas were excluded.
Compilation Method	Data was collected through tablets from households of selected Enumeration Blocks of urban areas and rural areas of Pakistan, team approach including Female Enumerators was adopted.

POPULATION CHARACTERISTICS

A country's current and future social and economic situation is affected by its age and sex composition.

2.1: Percentage Distribution of Population by Broad Age Group and Sex

Age distribution, also called Age Composition by sex, in population studies, differs among countries mainly because of differences in the levels and trends of fertility. The distribution of Population for PDS-2020 depicts that the proportion of children under 15 years is 35.5 percent for females and 37.84 percent for males. The proportion of Population is highest among age group 15-64 years, and lowest in age group of 65 years and above. Similar trend can be observed in both male and females. The proportion of old persons (65 years and over) is quite low. Only about 3 to 4 percent of population falls in this age group. Majority of population lies in the age group 15-64 i.e., 57.18 percent males and 57.78 percent females. This shows that Pakistan has large proportion of people in younger age group. This large proportion of young people not only indicates current high fertility rate but it also depicts that the population of Pakistan will continue to grow during period of declining fertility.

Table 2.1: Percentage Distribution of Population by Broad Age Group and Sex

	Age	Census-2017	PDS-2020
Male	< 15	40.95	37.84
	15-64	55.26	57.18
	65 +	3.79	4.63
Female	< 15	39.65	35.5
	15-64	56.72	57.78
	65 +	3.63	3.8

Figure 2.1: Percentage Distribution of Population by Broad Age Group and Sex

2.2: Sex Ratio

The Sex ratio is the ratio of males to females in a population. The comparison of Sex ratio of PDS-2020 with Census 2017 and Labor Force Survey 2018-19 shows that Sex ratio is 103 for both PDS 2020 and Labor Force Survey 2018-19, however it was 105 in Census 2017. Sex ratio is high in urban areas (104) as compared to rural areas (102).

Table 2.2: Sex Ratio by Urban and Rural Areas

Area	Census-2017	LFS 2018-19	PDS-2020
Pakistan	105	103	103
Urban	107	105	104
Rural	104	102	102

2.3: Population Pyramid

Population's age and sex distribution is graphically displayed by a pyramid. The numbers or proportions of males and females are represented by horizontal lines in each group. A population pyramid clearly explains the population structure at a glance. The PDS-2020 pyramid shows data in age groups. The rapid growth of population is obvious from higher concentration of young population groups.

Figure 2.2: Population Pyramid for PDS-2020

HOUSEHOLD CHARACTERISTICS

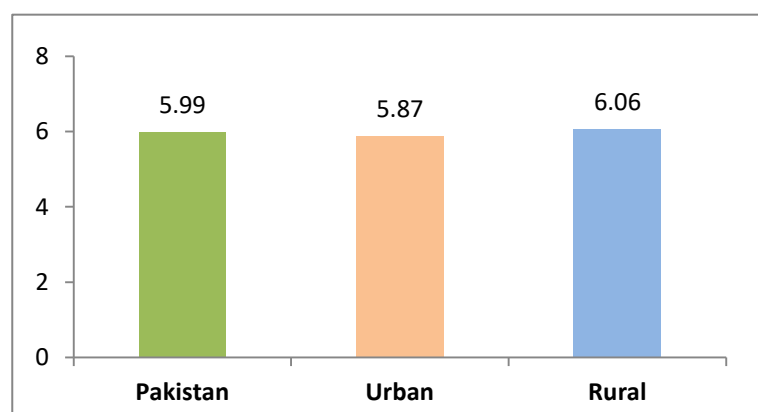

A household consists of one or several persons who live in the same dwelling and share meals. A household is often defined as one or more persons who occupy a single housing unit. Household consist of unrelated or related persons by birth, marriage or adoptions.

2.4: Household Size

The term "size of household" includes all the people occupying a housing unit. A household consists of all the people who occupy a housing unit and share their meals. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit. The unrelated persons or the persons related by birth, marriage or adoption constitute a household. A household may consist of a single family or more than one family who share their meal and have a joint kitchen. In Pakistan households tend to be large with an average of six to seven persons living and eating together in a single household. The household size in Pakistan according to PDS-2020 is 6 persons per household. HH size is higher in rural areas as compared to urban areas.

Table 2.3: Average Household Size by Urban-Rural Residence				
AREA	Census-2017	PDHS 2017-18	PSLM 2018-19	PDS-2020
Pakistan	6.39	6.60	6.24	5.99
Urban	6.12	6.30	5.97	5.87
Rural	6.55	6.80	6.40	6.06

Figure 2.3: Average Household Size

2.5: Percentage distribution of households by number of persons

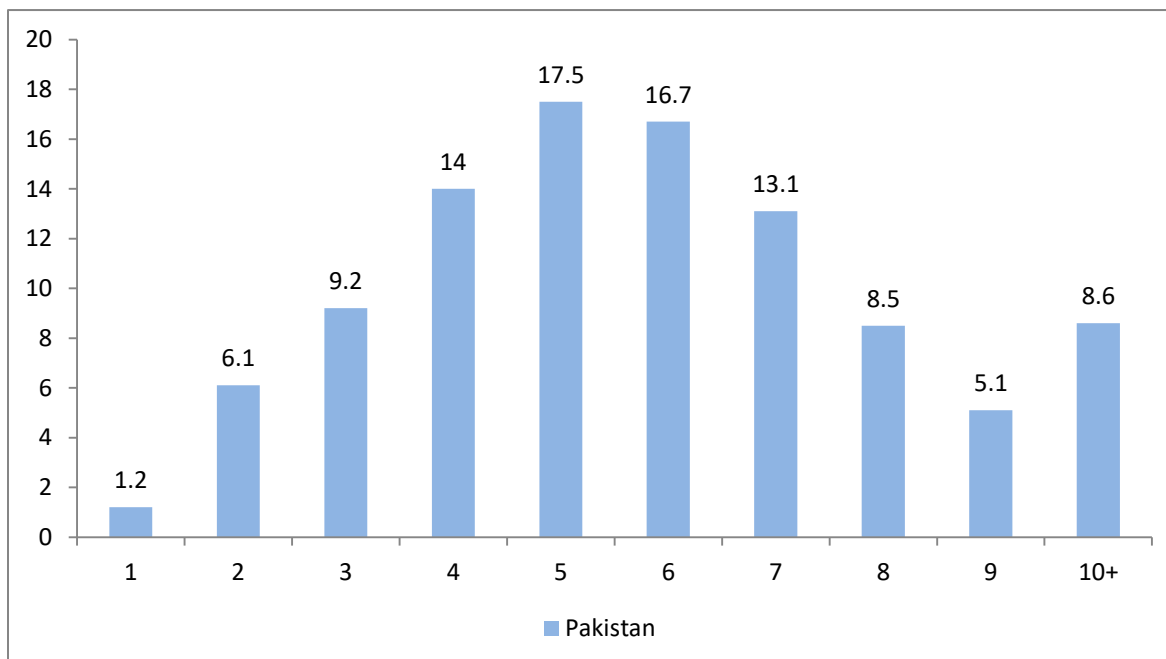

The Average household size in Pakistan is 6 persons, but about 30 percent of all households have four or fewer members. The breakdown by place of residence shows that there are more members in rural households (6.06 persons) than in urban households (5.87 persons). Table 2.4 shows that the share of single person's households is 1.2 percent. Households with 5 or less persons constitute about 48 percent of the total households. 43 percent of the population lives in households of size 6 to 9 whereas the

Household constituting 10 or more members are 8.6 percent. In urban area household with 5 or less persons have constituted about 50 percent of the total households. 43 percent of the population lives in households of size 6 to 9 whereas the households constituting 10 or more members are 7.1 percent. In rural area, household with 5 or less persons are about 47 percent of the total households. 44 percent of the population lives in a household size of 6 to 9 whereas the households constituting 10 or more members in rural area are 9.4 percent.

Table 2.4: Percentage Distribution of Households by Number of Persons

No of Persons	Pakistan	Urban	Rural
1	1.2	1.3	1.2
2	6.1	5.8	6.2
3	9.2	9.1	9.2
4	14.0	15.1	13.4
5	17.5	19.1	16.6
6	16.7	17.9	16.1
7	13.1	12.9	13.1
8	8.5	7.4	9.2
9	5.1	4.4	5.5
10+	8.6	7.1	9.4

Figure 2.4: Percentage Distribution of Households by Number of Persons

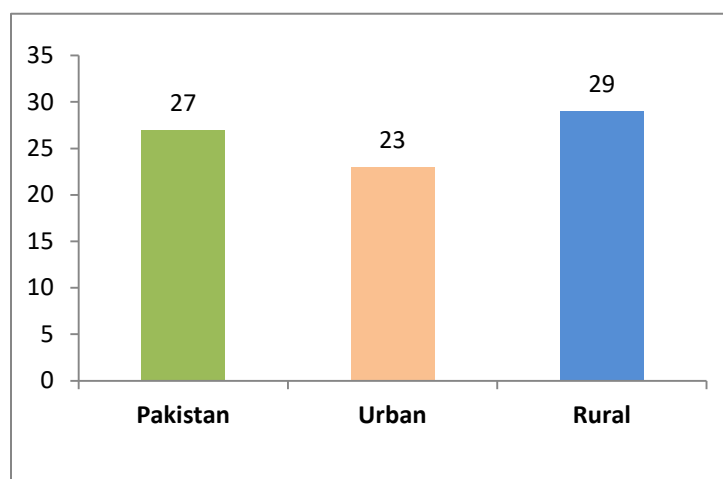

3.1: Crude Birth Rate

Crude Birth Rate (CBR) is the numbers of births during a year per 1000 persons. CBR is the simple way of measuring current fertility level in any population. The pace at which new members are born in a society is defined as Crude birth rate. The crude birth rate is called "crude" because total population is represented in the denominator and it does not take into account age or sex differences among the population. Crude Birth Rate as obtained from the PDS-2020 for the year 2020 is 27 per 1000 persons. According to PDHS 2017-18 it was 29 in 2017-18. Fertility is subject to a number of limitations, as it includes certain segments of population in the denominator that are not "exposed to risk" of child-bearing. Crude Birth Rate (CBR) is 27 per thousand persons in PDS-2020. CBR is higher in rural areas as compare to urban areas.

Table 3.1: Crude Birth Rate by Urban Rural Residence		
Area	PDHS-2017-18	PDS-2020
Pakistan	29	27
Urban	26	23
Rural	31	29

Figure 3.1: Crude Birth Rate

3.2: General Fertility Rate

General Fertility Rate (GFR), is the number of births in a year per 1000 women of child-bearing ages (15-44). GFR relates birth to the age-sex group at risk of giving birth. GFR helps eliminate distortions that occur due to different age and sex distribution among populations. Table 3.2 shows the General Fertility Rates obtained from PDS-2020 and PDHS 2017 18. Area wise comparison indicates that General Fertility Rates are higher in rural areas as

Table 3.2: General Fertility Rate by Urban Rural Residence		
Area	PDHS 2017-18 (15-44)	PDS-2020 (15-44)
Pakistan	124	124
Urban	106	102
Rural	134	138

compared to urban areas of the country. At National level GFR is 124. Several contributory factors such as lack of awareness, less priority to women health, seeking for the desired infant gender, stereotype thinking to adopt contraceptive measures, early marriages, cultural norms, couple education and low level of women education are some noticeable factors.

Figure 3.2: General Fertility rate

3.3: Age Specific Fertility Rate

Age Specific Fertility Rate (ASFR) is a refined way to measure fertility trends. Age specific fertility rate measures the number of annual births to women of specified age group as per 1000 thousand women in the same age group. Table 3.3 shows the comparison of ASFR in PDHS 2017-18, PSLM 2018-19 and PDS 2020 (2018-20). In general, fertility is comparatively low among women of ages less than 20 years and over 39 years. It is concentrated at the ages 20-39 years. It is quite visible from the figure 3.3 that the age specific fertility rate rises sharply for age group 20-24 years and reaches the peak in the age group 25-29 years, then declines slowly up to age 35-39 years and rapidly declining for the age groups 40-44 and 45-49 years. This trend can be observed in both urban and rural areas of the country. ASFR is high in rural areas as compare to urban areas for the all age group.

Figure 3.3: Age Specific Fertility Rate

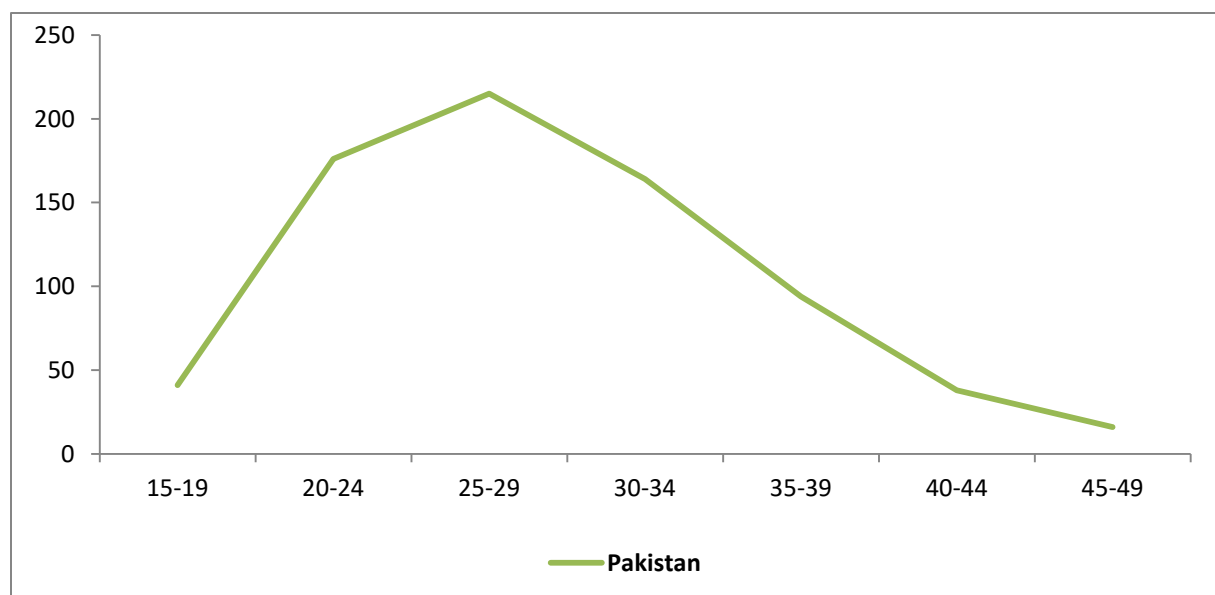

Table 3.3: Age Specific Fertility Rate (Per 1000 Women) by Urban-Rural Residence

Age Group	PDHS 2017-18			PSLM 2018-19			PDS-2020		
	Pakistan	Urban	Rural	Pakistan	Urban	Rural	Pakistan	Urban	Rural
15-19	46	42	47	54	38	65	41	29	48
20-24	171	142	186	187	153	208	176	146	193
25-29	215	200	224	214	184	233	215	195	227
30-34	160	133	177	157	130	174	164	143	177
35-39	79	56	95	86	66	99	94	71	108
40-44	28	11	40	32	19	40	38	23	47
45-49	12	1	18	19	11	23	16	7	22

3.4: Total Fertility Rate

Total Fertility Rate (TFR) is the summary measures of current fertility level. TFR indicates the number of children to be born to a woman during her reproductive span of life, if she were to pass through all her childbearing years conforming to the age-specific fertility rates of a given year. The advantage of this measure is that it is less influenced by the age structure of the population. TFR is the most useful indicator of fertility because it gives the best pictures of how many children women are currently having. The TFR depicted by the PDS 2020, PDHS 2017-18 and PSLM- 2018-19 is given in Table No. 3.4. TFR in urban areas is lower than that in rural areas in all surveys. For PDS-2020, TFR for urban area is 3.1, for rural areas it is 4.1 and at national level it is 3.7. The rural urban difference recorded could be due to several factors e.g. lack of awareness, access to health facilities, stereotype thinking, trend of having big families, etc.

Table 3.4: Total Fertility Rate by Urban-Rural Residence

Area	PDHS-2017-18	PSLM-2018-19	PDS-2020 (2018-20)
Pakistan	3.6	3.7	3.7
Urban	2.9	3.0	3.1
Rural	3.9	4.2	4.1

Figure 3.4: Total Fertility Rate

4.1: Crude Death Rate

Crude Death Rate is defined as the number of deaths during a year per 1000 persons. Crude death rates are the actual measures of mortality risks in a population. Crude Death Rate (CDR) obtained from PDS-2020 for the year 2020 is 6.7 per thousand persons for Pakistan. Whereas for urban area it is 6.6 and 6.7 for rural area. The Crude Death Rate is higher in rural areas than in urban areas. The crude mortality rate is a good indicator of the general health status of a geographic area or population. Crude rates are influenced by the underlying age distribution of the population. As mortality varies greatly with age, this implies that a population's age structure strongly influences its crude death rate. Therefore, the measure is of limited use for comparing mortality in different populations.

Table 4.1: Crude Death Rate by Urban-Rural Residence

Area	Total
Pakistan	6.7
Urban	6.6
Rural	6.7

Figure 4.1: Crude Death Rate

4.2: Sex and Age Specific Mortality Rates

Age-specific Mortality rate or Age-specific Death rate allows analysis of mortality patterns by age and sex.

Figure 4.2: Age Specific Death Rate

The Age Specific Death Rate (ASDR) starts at a very high peak immediately after birth, declines to a minimum value for the young age population (5-14 years), and rises gradually among the age groups 40-44 years and then rapidly increases at the advanced ages. This pattern has been observed for both males and females (Table 4.2). Females have higher chances of survivorship in all countries of the world, with only a few exceptions. Same universal pattern has been observed in Pakistan, i.e. female life expectancy is higher than male life expectancy. Females have lower death rates than the males for most ages specially a slight bump in mortality of men aged 25-29 can be seen which may be because of increased risky behavior and subsequent deaths due to accidents. The graphical representation of Sex and Age Specific Death Rate shows that after age 1, the mortality rate falls gradually, attaining minimum risk at age 10 the mortality rate is very low during childhood, then increases exponentially from age 30.

Table 4.2: Sex and Age Specific Mortality Rates

Age Group	All	Male	Female
Below 1	100.80	101.96	99.56
01-04	2.62	2.75	2.49
05-09	0.64	0.74	0.54
10-14	0.45	0.46	0.44
15-19	1.08	1.09	1.07
20-24	1.04	1.03	1.04

60-64	22.41	21.12	23.82
65-69	31.23	30.02	32.69
70-74	45.60	47.65	43.01
75-79	54.99	54.61	55.47
80-84	105.21	109.14	100.70
85+	160.74	163.45	157.59

4.3: Infant Mortality Rate (IMR)

Infant Mortality Rate (IMR) measures the mortality below one year of age. It is defined as the number of infant deaths during a calendar year per 1000 live births in the same year. Infant Mortality is an important

Table 4.3: Infant Mortality Rate

Area	PDHS 2017-18	PSLM 2018-19	PDS-2020 2018-20
Pakistan	62	60	56

indicator to judge socio- economic conditions, cultural factors, status of hygiene and availability & utilization of medical services. In PDS-2020 IMR is calculated on the basis of data for the years 2018

to 2020. Table 4.3 exhibits that Infant Mortality Rate is declining in Pakistan, as it was 62 in PDHS 2017-18, 60 in PSLM 2018-19, and now it is 56 for PDS-2020 but it is still higher. Findings in Table 4.4 reveals that the probability of dying between birth and first birthday is much higher in rural areas 59 as compare to urban areas 50 due to better Neo- Natal and Post-Natal facilities. Male Infant Mortality Rate is 58 which is higher than female Infant Mortality Rate 55 in all areas.

Table 4.4: IMR by Urban-Rural Residence and Sex (2018-20)			
Area	Total	Male	Female
Pakistan	56	58	55
Urban	50	48	51
Rural	59	62	56

4.4: Neo- Natal and Post-Neo-Natal Mortality Rates

Neonatal Mortality rates measures the mortality below one month and Post Neonatal Mortality rates measures the mortality after one month upto one year. In PDS-2020 Neo-natal and Post-Neonatal Mortality rates are calculated on the basis of data for the years 2018 to 2020. Table 4.5 shows that mortality within the first month after birth is very high in urban and rural areas. The Neo-Natal Mortality in rural areas is 44 and in urban areas it is 39. Male Infant Mortality Rate is 58 and is higher than female Infant Mortality Rate i.e, 55 in all areas. Neonatal mortality remains a challenge in low- and middle-income countries where there are poor health system, infrastructure and critical shortages of health personnel who are able to adequately manage and provide quality care.

Table 4.5: Neo-Natal Mortality Rates by Urban-Rural Residence and Sex			
Area	Total	Male	Female
Pakistan	42	45	40
Urban	39	36	41
Rural	44	49	39

Mortality	PDHS 2017-18	PDS-2020 (2018-20)
Neo-Natal	42	42
Post Neo-Natal	20	14

4.5: Causes of Death

The major cause of death in 2020 is cardiovascular disease (14.74%), followed by Fever (9.28%), Paralysis (6.45%), Cancers (5.5%) and Diabetes (5.63%). The details of leading causes of death in 2020 are shown in Table 4.7. Cardiovascular Diseases (Ischemic Heart Disease and Stroke) is top

global cause of death. Neo natal conditions – which include birth asphyxia and birth trauma, neonatal sepsis and infections, and preterm birth complications, are mostly included in complications during pregnancy/ delivery, post Natal Complications and respiratory diseases.

Table 4.7: Percentage Distribution of Causes of Death in 2020

Causes of Death	Percentage
Cardiovascular Disease	14.74
Fever	9.28
Paralysis (Stroke)	6.45
Diabetes	5.63

Surgical Complication	0.16
Leukemia	0.14
Others	0.32
Unknown Causes	21.40

5.1: Rate of Natural Increase

The rate of natural increase is the rate at which a population is increasing (or decreasing) in a given year due to surplus (or deficit) of birth over deaths, expressed as percentage of the base population. The Rate of Natural Increase depicted from PDS-2020 for the year 2020 is 2.0 (Table 5.1). High Rate of Natural Increase during the last few decades is the result of a steadily declining trend in mortality with only moderate decline in fertility.

Table 5.1: Rate of Natural Increase

Birth Rate	27.0
Death Rate	6.7
Rate of Natural Increase	2.0

5.2: Life Expectancy

The Life Expectancy at birth is a summary measure Index that is obtained from a life table. It shows the average number of years that persons can expect to live from the time of birth if they experience currently prevailing age specific death rates throughout their life. The expectation of life at birth is independent of the age structure of a population and therefore provides a more reliable index for international comparisons of the level of mortality and social and economic condition of a country. Table 5.2 exhibits that Life Expectancy at Birth was 65.4 in Pakistan Maternal Mortality Survey (PMMS)-2019 and in PDS-2020 the life expectancy at birth for the year 2020 in Pakistan is 65 years; it is 64.5 for males and 65.5 for females. The life expectancy increases for age 1-4 both for males and females i.e., 70.6 and 72 respectively and 71.3 overall.

Table 5.2: Life Expectancy at Birth by Sex

Life Expectancy at Birth	PMMS-2019	PDS-2020
Male	64.3	64.5
Female	66.5	65.5
Total	65.4	65.0

5.3: Life Table

Life table is used to simulate life time mortality experience of a population. It is the most powerful tool in Demography. In life table, the age specific death rates of population are applied to a hypothetical population of 100,000 people born at the same time. For each year on the life table, death inevitably thins the hypothetical population's ranks until, in the bottom row of table, even the oldest people die. Abridged life tables for males and females are calculated separately.

The life expectancies of male and female for different age groups for the year 2020 are given in table 5.3 and 5.4 respectively.

Table 5.3: Life Table Male

Explanation of the columns of the life table

${}_nq_x$	Proportion of person alive at the beginning of the age interval, who die during the age interval.
l_x	The number surviving to the beginning of the age interval.
${}_nd_x$	The number of persons in the cohort who die in the age interval (x, x+n).
${}_nL_x$	Person-years of life in the age interval.
T_x	Total person-years of life contributed by the cohort after attaining age x.
e_x	Average number of years of life remaining for a person alive at the beginning of age interval x.

DETAILED TABLES

- The sample of PDS-2020 is representative at National level with urban/rural breakdown, however the tables are compiled at provincial level too, therefore, the provincial tables need to be used carefully to avoid any misleading situation.

- Population and Fertility tables are calculated from roster.

- Population projection of NIPS, based on 2017 population & Housing Census results have been used.

- Slight differences in totals are due to round off errors while raising the results.

Sex Ratio

Sex Ratio is the ratio of males to females in a given population, usually expressed as the number of male for every 100 females. (*Haupt, & Kane. 2001*)

$$\text{Sex Ratio} = \frac{\text{Number of Males}}{\text{Number of Females}} \times 100$$

Household

A household is often defined as one or more persons who occupy a single housing unit. Household consist of unrelated or related persons by birth, marriage or adoptions. (*Haupt, & Kane. 2001*)

In addition to above definition the individuals living together, having common food consumption and intermingling of income and production decision are considered as part of household in PDS-2020.

Crude birth rate

The pace at which new members are born in a society is defined as Crude birth rate. It cannot provide information that how many children women have. CBR data is easily available and its estimation is simpler however it is influenced by age and sex structure of the population. (*Hartnett, C, S. 2016*)

$$\text{Crude birth rate} = \frac{\text{Number of births}}{\text{Total population}} \times 1000$$

Fertility

In demography fertility refers to as the reproduction output rather than the ability to have children. It further defines fertility as fecundability which is the probability of being pregnant or the likelihood to the exposure of possibility which certainly depends on the sexual pattern or pregnancy preventive behaviour. (*O Frank, 2021*)

Fertility rates are the measures of childbearing in a population. They are important determinants to measure the growth rate of population and its age structure. Some fertility measures are considered true rates as the capture the risk factor of having a birth in specific period of time. Such measures are defined as the crude birth rate, age specific fertility rates and general fertility rate. (*Hartnett, C.S 2016*)

General fertility rate

General fertility rate is defined as the number of births in a given year multiplied by 1000, divided by the total number of women of age 15-49 at mid-year. GFR partially counts the age and sex structure. It is not affected by the population size of men and girl population sizes under the age of 15 and women population size above 45. However it is affected by age distribution within the women group of child bearing age. (*Hartnett, C, S. 2016*)

$$\text{General Fertility Rate (GFR)} = \frac{\text{Number of birth per year}}{\text{No of Women age 15-49}} \times 1000$$

Age specific fertility rate

Age specific fertility rate measures the number of annual births to women of specified age group as per 1000 women in the same age group. The ASFR is computed as a ratio in which the numerator is number of live births to women in a particular age group during a specific period of time and the denominator is estimated number of person-years lived by women in the same age during the same period of time. (*United Nations, 2019*)

e.g, for age group 20-24

$$\text{Age Specific Fertility Rate (ASFR)} = \frac{\text{Number of birth to Women age 20-24}}{\text{Number of Women age 20-24}} \times 1000$$

Total fertility rate

Total fertility rate is defined as the mean number children a women have by age 50 if she survived it is defined as the number of children per women. TFR is computed as the sum of Age Specific Fertility rates divided by 1,000 (*United Nation, 2019*).

Crude death rate

Crude death rate is the number of deaths during a year per 1000 persons (based on survey population). (*Haupt, & Kane.2001*)

$$\text{Crude death rate} = \frac{\text{Number of deaths}}{\text{Total population}} \times 1000$$

Age specific death rate

Age specific death rate can be calculated for specific age groups in order to compare mortality at different age or at the same age over time. (*Haupt, & Kane. 2001*)

Infant mortality rate

Infant mortality rate is the number of deaths of infants under age 1 per 1000 live births in a given year. (*Haupt, & Kane. 2001*)

$$\text{Infant mortality rate} = \frac{\text{Number of infant deaths}}{\text{Total number of live births}} \times 1000$$

Neo-natal mortality rate

Neo Natal mortality is defined as the newborn death on or before 28 days expressed as per 1000 live births. (*Tripathy & Mishra, 2017*)

$$\text{Neonatal mortality rate} = \frac{\text{Number of neonatal deaths}}{\text{Total number of live births}} \times 1000$$

Post-neo-natal mortality rate

Post neo natal is defined as the death of the newborn between 28 days to one year of age expressed as per 1000 live births. (*Tripathy & Mishra, 2017*)

$$\text{Post neonatal mortality rate} = \frac{\text{Number of post neonatal deaths}}{\text{Total number of live births}} \times 1000$$

Life expectancy at birth

Life expectancy at birth is defined as the average number of years that a person is expected to live. It is considered an important indicator to assess the socio-economic development of a country. The disparity in Life Expectancy pattern is considered the root cause in different socio-economic backgrounds of different societies or groups. (*Bilas, V. et al 2017*)

Life Table

The life table is used to simulate the life time mortality experience of a population. It does so by taking that population's age-specific death rates and applying them to a hypothetical population of 100,000 people born at the same time. (*Haupt, & Kane. 2001*)

Rate of Natural Increase (RNI)

The rate of natural increase refers to the difference between the number of live births and the number of deaths occurring in a year, divided by the mid-year population of that year, multiplied by a factor (usually 1,000). It is equal to the difference between the crude birth rate and the crude death rate. This measure of the population change excludes the effects of migration. (*United Nations, 1991*)

SECTION- 1: HOUSEHOLD ROSTER

[illegible]

SECTION- 2: FERTILITY**(All Ever Married Women Aged 15-49 years)**

ID CODE from roster for all ever married women aged 15-49 year	1.Age at first Marriage (In complete years)	2.Duration since first Marriage		3. Have you ever given live birth? 1=Yes 2=No → Q 10	4.Age at the time of first birth (In complete years)	5.When first child born after first marriage (In complete months)	6. How many children ever born alive (if none write "00")			7.Of these children how many are presently living (if none write "00")				8. Have you ever given birth to any child who born alive but later died, even if they lived for few minutes or hours? 1=Yes 2=No→ Q10	9. How many died?		10.Have you ever had a still birth 1=Yes 2=No
		Year	Month							With You		Else Where			B	G	
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18

Live Birth:- A birth is counted as a live birth if the baby breathed or showed any sign of life ,even if he/she live only a few minutes.

Particulars of Child Born during Last Three Years (1st January 2018 to 31st December 2020) If No then skip this section[illegible]

SECTION- 4: DEATH ENUMERATION

Q1. Any death occurred during last three years (1st January 2018 to 31st December 2020)

9

1=Yes (fill Q2 and give details of each death.), **2=No** (End of interview).

[illegible]

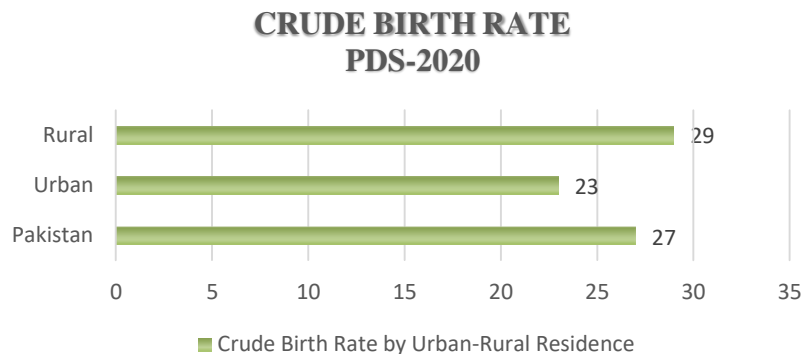

Codes for causes of death

44. Death Penalty	44
45. Martyred	45
46. Death in Bomb Blast	46
47. Other (Specify)	47

CRUDE BIRTH RATE

Crude Birth Rate (CBR) is the numbers of births during a year per 1000 persons. CBR is the simple way of measuring current fertility level in any population. The pace at which new members are born in a society is defined as Crude birth rate.

Crude Birth Rate as obtained from the PDS-2020 for the year 2020 is 27 per 1000 population. Crude Birth Rate (CBR) is 27 per thousand persons in PDS- 2020. CBR is higher in rural areas as compared to urban areas.

CRUDE DEATH RATE

Crude Death Rate is defined as the number of deaths during a year per 1000 persons. Crude death rates are the actual measures of mortality risk in a population.

Crude Death Rate (CDR) obtained from PDS-2020 for the year 2020 is 6.7 per 1000 population for Pakistan. Whereas for urban area it is 6.6 and 6.7 for rural area. The Crude Death Rate is slightly higher in rural areas than in urban areas. The crude mortality rate is considered as a good indicator of the general health status of a geographic area or population.

RATE OF NATURAL INCREASE

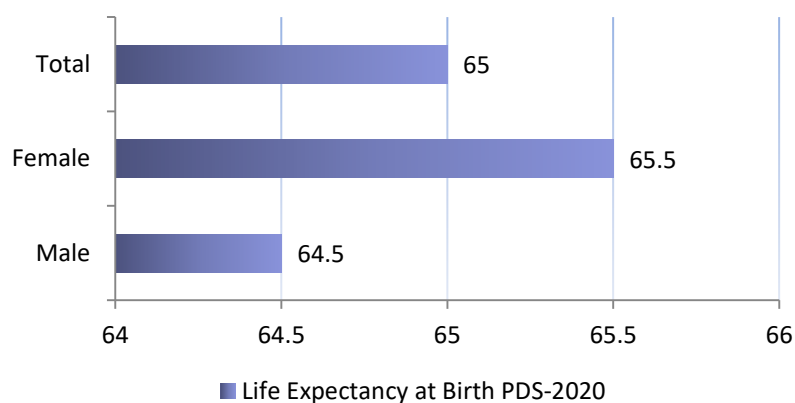

The rate of Natural increase is the rate at which population is increasing or decreasing in a given year due to surplus or deficit birth over deaths expressed as percentage of the base population.

Crude Birth Rate (CDR) as obtained from the PDS-2020 is 27 per 1000 population and Crude Death Rate (CDR) is 6.7 per 1000 population. The Rate of Natural Increase depicted from PDS-2020 is 2.0. High Rate of Natural Increase during the last few decade is the result of steadily declining trend in mortality with only moderate decline in fertility.

LIFE EXPECTANCY AT BIRTH BY SEX

The Life Expectancy at birth is a summary measure Index that is obtained from a life table. It shows the average number of years that persons can expect to live from the time of birth if they experience currently prevailing age specific death rates throughout their life.

The Life Table of PDS-2020 for the year 2020 depicts that the expectancy of life at birth in Pakistan is 65 years; it is 64.5 for males and 65.5 for females. The life expectancy increases for age 1-4 both for males and females i.e., 70.6 and 72 respectively and 71.3 overall.

TOTAL FERTILITY RATE

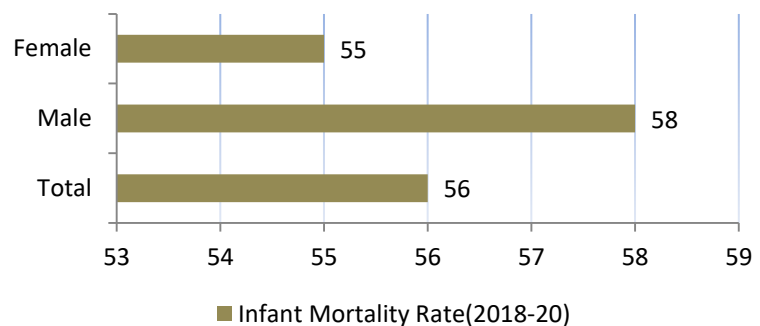

Total Fertility Rate is the summary measures of current fertility level. It indicates the number of children to be born to a woman during her reproductive span of life.

The TFR depicted by the PDS 2020 (2018-20) is 3.7. In urban areas TFR is 3.1 and in rural areas it is 4.1. The advantage of this measure is that it is less influenced by the age structure of the population. TFR is the most useful indicator of fertility because it gives the best pictures of how many children women are currently having.

INFANT MORTALITY RATE

Infant Mortality Rate (IMR) measures the mortality below one year of age. It is defined as the number of infant deaths during a calendar year per 1000 live births in the same year.

Infant Mortality is an important indicator to judge socio- economic conditions, cultural factors, status of hygiene and availability & utilization of medical services. In PDS-2020 IMR calculated on the basis of data for the years 2018 to 2020 , exhibits that Infant Mortality Rate is declining in Pakistan
